

Uzbekistan OS

Design System Specification (DSS)

Version 1.0

1. Purpose

Defines the complete visual language and reusable UI foundation for Uzbekistan OS, including design tokens, typography, color system, spacing, layout, components, motion, accessibility, responsive behavior, and implementation mapping.

2. Design Philosophy

The experience should feel clear, calm, confident, modern, trustworthy, human, and fast. Interfaces should prioritize content over decoration while remaining approachable.

3. Visual Principles

Emphasize clarity, simplicity, consistency, hierarchy, and trust. Typography, spacing, and layout should create hierarchy rather than excessive color or ornamentation.

4. Color System

Primary: Deep Azure (#0A84FF). Success: Emerald (#30D158). Warning: Amber (#FF9F0A). Error: Red (#FF453A). Information: Sky Blue (#64D2FF). Use a neutral 12-step grayscale and semantic color tokens instead of hardcoded values.

5. Semantic Design Tokens

Use tokens such as `color.primary`, `color.surface`, `color.background`, `color.textPrimary`, `color.success`, `spacing.*`, `radius.*`, `typography.*`, `motion.*`, `border.*`, and `shadow.*` as the single source of truth.

6. Dark Mode

Treat dark mode as a first-class experience with softened backgrounds, preserved hierarchy, and accessible contrast ratios rather than simple color inversion.

7. Typography

Primary font: Inter with system fallback. Standardized hierarchy: Display, H1, H2, H3, Body Large, Body, Small, Caption using consistent line heights and font weights.

8. Grid & Layout

Desktop: 12-column grid. Tablet: 8-column. Mobile: 4-column. Use an 8-point spacing system, generous whitespace, and constrained reading widths for long-form content.

9. Spacing & Radius

Spacing tokens follow a 4/8/12/16/24/32/48/64 scale. Rounded corners: Buttons 12px, Inputs 12px, Cards 24px, Dialogs 28px, Sheets 32px.

10. Elevation & Borders

Three elevation levels only. Prefer subtle borders over heavy shadows for a clean, modern appearance.

11. Motion System

Motion should communicate state changes, loading, and hierarchy. Standard durations: 150ms, 200ms, and 300ms with support for reduced-motion accessibility.

12. Component Architecture

Every component must define purpose, variants, interaction states, accessibility requirements, design tokens, documentation, and automated tests.

13. Core Components

Buttons, inputs, cards, chat bubbles, citations, workflow cards, checklists, navigation, timelines, badges, dialogs, toasts, tables, forms, skeleton loaders, and AI-specific interface elements.

14. Navigation System

Support left navigation for desktop, bottom navigation for mobile, breadcrumbs, tabs, segmented controls, and consistent interaction behavior.

15. AI Components

Include evidence cards, source previews, confidence indicators, reasoning summaries, workflow suggestions, checklist previews, and related question components.

16. Responsive Design

Every component must define desktop, tablet, and mobile behavior without requiring redesign.

17. Accessibility

Target WCAG 2.2 AA compliance, keyboard navigation, semantic HTML, ARIA support, reduced motion, visible focus states, color-independent communication, and minimum 44x44px touch targets.

18. Design Tokens & Code Mapping

Expose colors, spacing, typography, shadows, borders, radii, breakpoints, motion, and z-index through CSS custom properties synchronized with Tailwind and Figma.

19. Figma Organization

Separate Foundations, Components, Patterns, Templates, Prototypes, and Documentation using Auto Layout, Variables, Component Variants, and developer annotations.

20. File Structure

Organize tokens, components, documentation, and Figma assets into a shared design-system package for implementation consistency.

21. Quality Checklist

Every new component must be reusable, documented, accessible, responsive, token-driven, tested, and solve a unique product need.

22. Recommended Technology Stack

Figma Variables, Auto Layout, Next.js, React, Tailwind CSS, shadcn/ui, Radix UI, Lucide Icons, Framer Motion (minimal usage), and CSS custom properties as the canonical design token source.

23. Definition of Done

The DSS is complete when all visual foundations, semantic tokens, reusable components, accessibility rules, responsive behavior, implementation mappings, and documentation are fully specified and ready for engineering implementation.
